Abstract

This appendix shows results for two-year outcomes and sub-groups defined by pre-treatment covariates and registration cohort. These estimates are provided for transparency as specified in the pre-analysis plan.

*Corresponding author: Jens Hainmueller, 417 Galvez Mall, Stanford, CA 94305; jhain@stanford.edu.

- Results with Two-Year Outcomes: Tables [B1](#), [B2](#), [B3](#), and [B4](#) show the results for two-year outcomes.
- Results for Sub-Groups: Following our pre-analysis plan, here we show estimates that replicate the main models for samples restricted to specific sub-groups of registrants defined by specific pre-treatment measures. Note that these estimates are based on smaller sample sizes and therefore should be interpreted with caution. The pre-specified subsets of registrants for the credit bureau data are defined as follows: Household income (below and above the sample median) and language (registered in English or in a language other than English). The pre-specified subsets of registrants for the survey data are defined as follows: Gender (female and male), language (registered in English or in Spanish), education (high school degree or less versus some college or BA degree), and household income (below and above the sample median). Tables [B5](#) to [B8](#) show the subgroup estimates for the three-year financial outcomes based on the credit bureau data. Tables [B9](#) to [B18](#) show the subgroup estimates for the three-year financial outcomes based on the survey data. Tables [B19](#) to [B28](#) show the subgroup estimates for the three-year economic mechanism outcomes based on the survey data. Tables [B29](#) to [B38](#) show the subgroup estimates for the three-year non-economic integration outcomes based on the survey data.
- Results by Registration Cohort: Following our pre-analysis plan here we show estimates that replicate the main models for samples restricted to each specific registration cohort, i.e. those who registered for the 2016, 2017, or 2018 lottery, respectively. Note that these estimates are based on smaller sample sizes and therefore should be interpreted with caution. Tables [B39](#) to [B41](#) show the subgroup estimates by cohort for the three-year financial outcomes based on the credit bureau data. Tables [B42](#) to [B44](#) show the subgroup estimates by cohort for the three-year financial outcomes based on the survey data. Tables [B45](#) to [B47](#) show the subgroup estimates for the three-year economic mechanism outcomes based on the survey data. Tables [B48](#) to [B50](#) show the subgroup estimates by cohort for the three-year non-economic integration outcomes based on the survey data.

Notes: The outcome is denoted in the column header and is measured two years after voucher assignment. Panel A presents the ITT effects and Panel B shows the LATE effects. All regressions control for randomization block dummies, HH income, English language as well as the outcome value at baseline. The sample is restricted to registrants who are matched in the two-year panel. All regressions are weighted by the block-level inverse probability of assignment into the treatment group. Robust standard errors are shown in parenthesis. * $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$.

$\bar{Y}$	0.879	0.679	0.965	0.841	9.082

Notes: Each entry is an estimated coefficient from a separate regression of the full panel model. Panel A presents the ITT effects and Panel B shows the LATE effects. All regressions control for individual and year fixed effects. The sample is restricted to individuals who are matched in the five-year panel. All regressions are weighted by the block-level inverse probability of assignment into the treatment group. Standard errors are clustered at the individual level and shown in parenthesis. * $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$.

Notes: The outcome is denoted in the column header and is measured three years after voucher assignment. The sample is restricted to a sub-sample of registrants as denoted in the table header as well as to registrants who are matched in the four-year panel. Panel A presents the ITT effects and Panel B shows the LATE effects. All regressions control for randomization block dummies, the covariates (apart from the subsetting covariate), as well as the outcome value at baseline. All regressions are weighted by the block-level inverse probability of assignment into the treatment group. Robust standard errors are shown in parenthesis. $*p < 0.05$, $**p < 0.01$, $***p < 0.001$.

Notes: The outcome is denoted in the column header and is measured three years after voucher assignment. "Overall Index*" refers to an integration index excluding the economic dimension. The sample is restricted to a sub-sample of registrants as denoted in the table header as well as to registrants who are matched in the four-year panel. Panel A presents the ITT effects and Panel B shows the LATE effects. All regressions control for randomization block dummies, the covariates (apart from the subsetting covariate), as well as the outcome value at baseline. All regressions are weighted by the block-level inverse probability of assignment into the treatment group. Robust standard errors are shown in parenthesis. * $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$.

All regressions are weighted by the block-level inverse probability of assignment into the treatment group. Robust standard errors are shown in parenthesis. * $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$.

Table B43: Subgroup Treatment Effects on Three-Year Financial Outcomes: Registrants from the 2017 Lottery (Survey Data)

Panel A: Intent To Treat Effects (ITT)						
	Income			Financial Distress		
	Log Income	Log Equivalized Income	Log Personal Income	Can Afford a \$500 Expense	Can Afford a \$1,000 Expense	Can Afford a \$10,000 Expense
Voucher	-0.022 (0.064)	0.002 (0.069)	0.091 (0.077)	-0.091 (0.053)	-0.009 (0.054)	0.033 (0.038)
N	380	376	361	424	424	424
$\bar{Y}$	10.648	10.265	10.411	0.612	0.406	0.154
Panel B: Local Average Treatment Effects (LATE)						
	Income			Financial Distress		
	Log Income	Log Equivalized Income	Log Personal Income	Can Afford a \$500 Expense	Can Afford a \$1,000 Expense	Can Afford a \$10,000 Expense
Citizenship	-0.377 (0.195)	-0.214 (0.216)	0.107 (0.225)	-0.290 (0.197)	-0.217 (0.182)	0.043 (0.124)
N	276	273	261	300	300	300
$\bar{Y}$	10.680	10.271	10.459	0.601	0.414	0.144

Notes: The outcome is denoted in the column header and is measured three years after voucher assignment. The sample is restricted to a sub-sample of registrants as denoted in the table header as well as to registrants who are matched in the four-year panel. Panel A presents the ITT effects and Panel B shows the LATE effects. All regressions control for randomization block dummies, the covariates (apart from the subsetting covariate), as well as the outcome value at baseline. All regressions are weighted by the block-level inverse probability of assignment into the treatment group. Robust standard errors are shown in parenthesis. * $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$.
